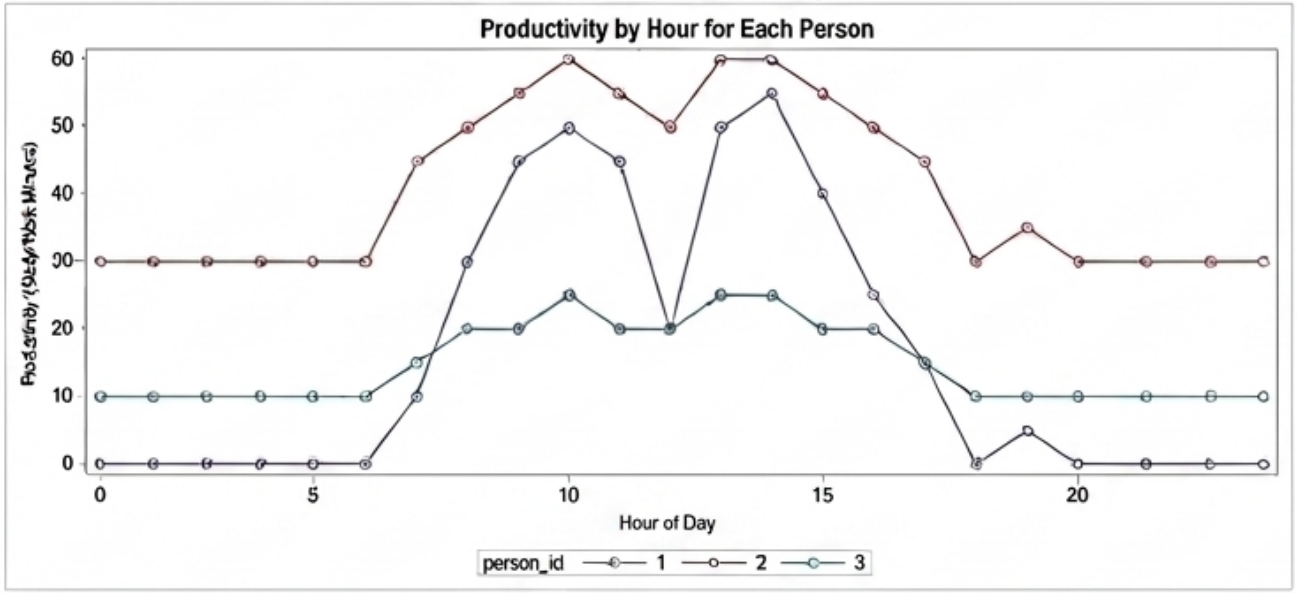
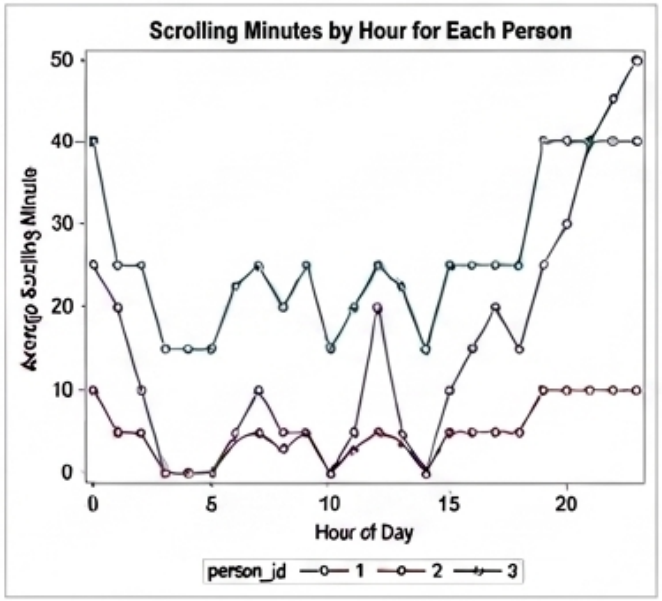
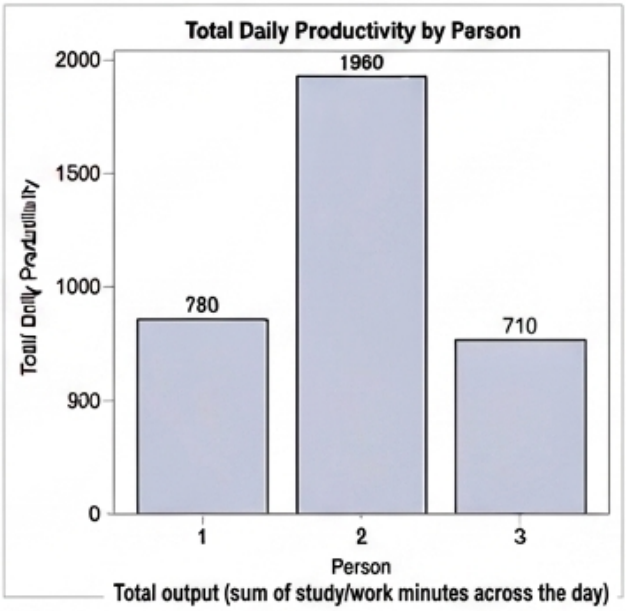
How Daily Habits Drive 2.5× Differences in Output

Behavioral Simulation Model | Built in SAS

Simulated behavioral dataset (n=144, 3 user profiles)







Simulated behavioral dataset (n=144 observations across 3 profiles)

Key Findings

- Optimized routine produced **2.5×** higher total output
- High-distraction routine lost **5×** more time to scrolling
- Peak output concentrated between **10 AM–2 PM**
- Loss of peak-energy time reduced overall productivity

Productivity differences are driven by time allocation efficiency—not effort—with high-performing profiles preserving peak energy windows and minimizing distraction.
