What This Means in Practice

Translating behavioral patterns into real-world productivity

User Profiles

High-Distraction Routine (Person 3)
- **~1250** min scrolling
- **~710** total output
- No sustained peak performance
- High stress and low energy

Average Routine (Person 1)
- **~720** min scrolling
- **~780** total output
- Midday productivity only
- Inconsistent performance

Optimized Routine (Person 2)
- **~238** min scrolling
- **~1960** total output
- Sustained high-output window
- Lower stress and higher energy

Key Implications

- Small reductions in distraction **yield disproportionate output gains**
- Protecting peak hours is **more effective than increasing effort**
- Productivity losses **result from time fragmentation, not lack of ability**
- **Routine consistency drives sustained performance**

The gap between high and low performance is not effort—it is the ability to consistently protect and utilize high-value time.

Simulated behavioral dataset (n=144, 3 user profiles)
